The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 1512 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are if it are associated to a promoter and a3 non-translated sequence that concluded to a promoter and a3 non-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mina modecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 1512 nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for level or pattern of the molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle tris useful for genome mapping, gene identification and analysis, cattle breading, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The molecule tage acide acide is the confidence become mapping or the molecule or acide acide acide the confidence become mapping or the molecule or acide acide acide acide the complementary nucleic acide is used for the detection of constructs for use in cattle gene expression, or for genetically improving cattle. The molecule tage acide acide acide the confidence acide aci
                                                                        New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bovine; ss; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence was not shown in the specification but was obtained in

```

```
The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 1512 nucleotide sequences, appearing as ABX34815-ABX49947, or complements of them. Also included are; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and 3 non-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3 non-translated sequence cell or tissue comprising a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the complementary nucleic acid is predictive of the level or pattern of the molecule. The LMFD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the list bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The
                                                                                                                                                   New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              shown in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bovine; ss; EST; expressed sequence tag; lactation; LMFD;

cartie, and the LMFD micret actu can specifically withints to a cartie, and molecule comprising any of 1512 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' annon-translated sequence that functions in the cell to cause termination of transcription and addition of polyademylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid where the complementary nucleic acid is predictive of the complementary nucleic acid is used for detecting the level or pattern of a molecule in a bovine cell or tissue. The LMFD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the contract of the present sequence is one of the contract of the contract of the present sequence is one of the contract of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second
                                                                                                                                                                                                                                                                                                      New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bovine, ss; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding.

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMPD), derived from cattle, and the LMFD nucleic acid can specifically bybridise to a second nucleic acid molecule comprising any of 1512 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are if (1) a transformed call having a nucleic acid comprising an LMFD nucleic caid linked to a promoter and a 3 non- translated sequence that conformed call to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the 1512 nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule obtained from the bovine cell or tissue, the detection of the complementary nucleic acid germits the detection of the molecule. The LMFD nucleic acid, where the detection of the molecule. The LMFD nucleic acid, such the complementary nucleic acid is used for the detection of constructs for use in cattle gene expression, or determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle for genetically improving cattle. The present sequence is one of the 1512 bovine LMFD EST (expressed sequence tag) nucleic acids note: The present sequence was not shown in the specification but was obtained in alert nor pattern of sequence was not shown in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                              New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 1512 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a3 non-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprementary nucleic acid molecule obtained from the bovine cell or complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for level or pattern of the molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle tria useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the content of the complement expenses and content of the content of constructs for use in cattle gene expression, or content of the content

New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are : (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and cit losue comprising: (a) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid where the detection of the complementary nucleic acid is predictive of the level or pattern of the molecule. The LMFD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or shown in the specification but was obtained in pretically improving cattle. The present sequence is one of the bovine LMFD EST (expressed sequence tag) nucleic acids. Note: 7 segdata.uspto.gov/sequence.html?DocID=20020137139 format from the USPTO web sit

New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.

Claim 2; SEQ ID NO 8757; 245pp; English

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49347, or complements of them. Also included are illused to a promoter and a 3' non- translated sequence that caid linked to a promoter and a 3' non- translated sequence that cfunctions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and complementary nucleic acid sequences or its complement cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and the complementary nucleic acid permits the detection of the molecule, and the complementary nucleic acid molecule obtained from the molecule, and the complementary nucleic acid is predictive of the externing a level or pattern of the complementary nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. Cell tis useful for genome mapping, gene identification and analysis, cattle complementary proparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the constructs of sequence tag) nucleic acids acids. present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site: segdata.uspto.gov/sequence.html?DocID=20020137139

lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49347, or complements of them. Also included are 1 (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and of polyadenylated ribonucleotides to a' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid permits the detection of the complementary nucleic acid sequences or its complementary nucleic acid permits the detection of the molecule. The LMFD nucleic acid is used for determining a level or pattern of the molecule in a bovine cell or tissue.

The detection of the complementary nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. The LMFD second analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the constructs for the constructs for the constructs for genetically income.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a purified nucleic acid molecule associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.

15112 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The present sequence was not shown in the specification but was obtained in Sequence 469 BP; 138 A; 160 C; 53 G; 117 T; 0 U; 1 Other; seqdata.uspto.gov/sequence.html?DocID=20020137139 lectronic format from the USPTO web site:

The present into the control of any animal species in polymerase chain med soy of see AB083297 and AB083299. Capable of amplifying a fragment of cytochrome b gene of any animal species in polymerase chain reaction of the identification of the biological material of any animal of unknown origin at species and sub-species level. Also described is a method for the identification of the animal from a biological sample. The method is used for animal identification to establish the crime with the criminal beyond a reasonable doubt, to establish the identity of biological materials such as skin, horns confiscated from animal confiscated animal hunting and related from animal concentration of animal hunting and related crime in the court of molecular evidence of animal hunting and related crime in the court of law, so that human violation of the geographical location of the commitment of wildlife crime based on the cytochrome b gene haplotype of controlled, to have an idea of the geographical location of the commitment of wildlife crime based on the cytochrome b gene haplotype of poached animal identified by the universal prime invented, to detect the adulteration of animal meat in food products for the purpose of food adulteration of animal meat in food products for the purpose of food fortification, by the food fortification agencies, to provide a universal technique for detection of the origin of blood or blood stains collected from the scene of the crime related to offenses such as marder and rape, the prime it sould be added to be comed an interval and its collected from the scene of the crime related to offenses such as marder and rape, the prime is some of the crime related to offense such as marder and rape, the collected to offense such as marder and rape, the collected to offense such as marder and rape, the collected to offense such as marder and rape. The present sequence represents converted to a commercial molecular kit and DNA chips based applications for wildlife identification in forensics. The present sequence represent when it sounds as if criminals intentionally spread the blood of an animal at the scene of the crime to confuse the crime investigators and forensic scientists with human blood, and so that the method can be present invention describes universal primers, mcb 398 and mcb 869 for wildlife identification in forensics. The present sequence repress a mitochondrial cytochrome b gene sequence from the present invention Gaps New universal primers, mcb 398 and mcb 869, capable of amplifying a fragment of cytochrome b gene of any animal species, useful for establishing the identity of biological materials and animals for molecular evidence in forensics. New universal primers, mcb 398 and mcb 869, capable of amplifying a fragment of cytochrome b gene of any animal species, useful for establishing the identity of biological materials and animals for molecular evidence in forensics

Example 1; Page 28-57; 128pp; English.

The present invention describes universal primars, mco 398 and mcb 899 (see AB083297) and AB083298), capable of amplifying a fragment of cytochrome b gene of any animal species in polymerase chain reaction of unknown origin at species and sub-species level. Also described is a method is used for animal identification to establish the crime with the criminal beyond a reasonable doubt, to establish the rime with the criminal beyond a reasonable doubt, to establish the rime with the criminal beyond a reasonable doubt, to establish the rime with the criminal beyond a reasonable doubt, to establish the rime with the criminal beyond a reasonable doubt, to establish the crime with the criminal beyond a reasonable doubt, to establish the crime with the crime till it is that of an endangered species, for the purpose of molecular evidence of animal hunting and related from animal controlled, to have an idea of the geographical location of the controlled, to have an idea of the geographical location of the commitment of wildlife crime based on the cytochrome b gene haplotype of poached animal identified by the universal primer invented, to detect the commitment of animal meat in food products for the purpose of food fortification agencies, to provide a universal certhique for detection of the origin of blood or blood stains collected from in order to establish the origin of blood found at the scene of the crime related to offenses such as murder and rape, in order to establish the origin of blood found at the scene of the crime to confuse the crime investigators and formerial at the scene of the crime to confuse the crime investigators and formered to a commercial molecular kit and DNA chips based applications of printed to a commercial molecular kit and DNA chips based applications of printed to a commercial molecular kit and DNA chips based applications of printed to the printed to a commercial molecular for the present sequence of printed to a commercial molecular for the printed printed printed for the printed printed The present invention describes universal primers, mcb 398 and mcb 869 a mitochondrial cytochrome b gene sequence from the present invention

Sequence 11264, Application US/09960352
Patent No. US20020137139A1
GENERAL INFORMATION:
APPLICANT: Warren, Weeley C.
APPLICANT: Byatt, John C.
TITLE OF INVENTION: NUCLEIC ACID AND OTHER MOLECULES ASSOCIATED WITH LACTATION AND TITLE OF INVENTION: MUSCLE AND FAT DEPOSITION
FILLE REFERENCE: 16511.006/37221(10298)C
CURRENT APPLICANTON NUMBER: US/09/960,352
CURRENT FILING DATE: 2001-09-24
NUMBER OF SEQ ID NOS: 15112
SEQ ID NO 11264
LENGTH: 414
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 5186, Application US/09960352
Patent No. US20020137139A1
GENERAL INFORMATION:
APPLICANT: Warren, Wesley C.
APPLICANT: Byat, John C.
APPLICANT: Mathialagan, Nagappan
TITLE OF INVENTION: NUCLEIC ACID AND OTHER MOLECULES ASSOCIATED WITH LACTATION AND TITLE OF INVENTION: MUSCLE AND PAT DEPOSITION
TITLE OF INVENTION: NUMBER: US/09/960,352
CURRENT APPLICATION NUMBER: US/09/960,352
CURRENT APPLICATION NOWER: 2001-09-24
NUMBER OF SEQ ID NOS: 15112
SEQ ID NOS: 15112

ø New universal primers, mcb 398 and mcb 869, capable of amplifying fragment of cytochrome b gene of any animal species, useful for establishing the identity of biological materials and animals for molecular evidence in forensics.

Claim 5; Page 116; 128pp; English.

The present invention describes universal primers, mcb 398 and mcb 869 (see AbQB31297 and ABQ81298), capable of amplifying a fragment of cytochrome b gene of any animal species in polymerase chain reaction (PCR) and revealing the identity of the biological material of any animal of unknown origin at species and sub-species level. Also described is a method for the identification of the animal from a biological sample. The method is used for animal identification to establish the crime with the

```
criminal beyond a reasonable doubt, to establish the identity of biological materials such as skin, horns confiscated from animal poachers, if it is that of an endangered species, for the purpose of molecular evidence of animal hunting and related crime in the court of law, so that human violation of the wildlife resources could be controlled, to have an idea of the geographical location of the commitment of wildlife crime based on the cytochrome b gene haplotype of poached animal identified by the universal primer invented, to detect the adulteration of animal meat in food products for the purpose of food fortification, by the food fortification agencies, to provide a universal form the scene of the crime related to offenses such as murder and rape, in order to establish the origin of blood found at the scene of the crime to confuse the blood stains collected from the scene of the crime to confuse the method of an animal at the scene of the crime to confuse the method can be converted to a commercial molecular kit and DNA chips based applications for wildlife identification in foremaics. The present sequence represents a specifically claimed Antilope cervicapra (blackbuck) mitochondrial

the present invention describes universal primers, mice jusquent of caee AB0813297 and AB083298, capable of amplifying a fragment of cytochrome b gene of any animal species in polymerase chain reaction cytochrome b gene of any animal species in polymerase chain reaction of unknown origin at species and sub-species level. Also described is a comethod is used for animal identification to establish the crime with the criminal beyond a reasonable doubt, to establish the crime with the criminal beyond a reasonable doubt, to establish the rime with the criminal beyond a reasonable doubt, to establish the rime with the criminal beyond a reasonable doubt, to establish the crime with the crime biological materials such as skin, horns confiscated from animal completes, if it is that of an endangered species, for the purpose of molecular evidence of animal hunting and related crime in the court of any, so that human violation of the wildlife resources could be controlled, to have an idea of the geographical location of the controlled, to have an idea of the geographical location of the controlled, to detect the poached animal identified by the universal primer invented, to detect the controlled, to animal meat in food products for the purpose of fortification, by the food fortification agencies, to provide a universal controlled from the scene of the crime related to offenses such as murder and rape, controlled from at the scene of the crime related to offenses such as murder and rape, in order to establish the origin of blood cound at the scene of the crime related to offense such as murder and rape, contrast the crime investigators and formalial at the scene of the crime to confuse the crime investigators and commercial molecular kit and DNA chips based applications converted to a commercial molecular kit and DNA chips based applications and probability in the present from the present services.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TCCCATACATCGGTACAAACCTAGTAGAATGAATCTGAGGAGGGTTCTCAGTAGATAAAG 120

the Present Invention describes universal primars, where the present invention describes universal primars, where the proposed strangment of cytochrome b gene of any animal species in polymerase chain reaction (PRR) and revealing the identity of the biological material of any animal of the dendical material of any animal companies. The method for the identification of the animal from a biological sample. The method is used for animal identification to establish the crime with the inciminal beyond a reasonable doubt, to establish the identity of biological materials such as skin, horns confiscated from animal pological materials such as skin, horns confiscated from animal concerns, if it is that of an endangered species, for the purpose of molecular evidence of animal hunting and related crime in the court of law, so that human violation of the wildlife resources could be controlled, to have an idea of the geographical location of the commitment of wildlife crime based on the cytochrome b gene haplotype of poached animal identified by the universal primer invented, to detect the adulteration of animal meat in food products for the purpose of findentification of animal meat in food products for the purpose of model animal meat in food products for the purpose of mindlife measure and the second secon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fortification, by the food fortification agencies, to provide a universal technique for detection of the origin of blood or blood stains collected from the scene of the crime related to offenses such as murder and rape, in order to establish the origin of blood found at the scene of the crime when it sounds as if criminals intentionally spread the blood of an

New universal primers, mcb 398 and mcb 869, capable of amplifying fragment of cytochrome b gene of any animal species, useful for establishing the identity of biological materials and animals for molecular evidence in forensics.

Example 1; Page 28-57; 128pp; English.

The present invention describes universal primers, mcb 398 and mcb 869

(See AB083297 and AB083298), capable of amplifying a fragment of
cytochrome b gene of any animal species in polymerase chain reaction
(PCR) and revealing the identity of the biological material of any animal
CC of unknown origin at species and sub-species level. Also described is a
method for the identification of the animal from a biological sample. The
CC of unknown origin at species and sub-species level. Also described is a
method is used for animal identification to establish the crime with the
CC criminal beyond a reasonable doubt, to establish the identity of
Diological materials such as skin, horns confiscated from animal
CC criminal beyond a reasonable doubt, to establish the identity of
Diological materials such as skin, horns confiscated from animal
CC controlled, to have an idea of the wildlife resources could be
CC commitment of wildlife crime based on the cytochrome b gene haplotype of
CC poached animal identified by the universal primer invented, to detect the
CC fortification, by the food fortification agencies, to provide a universal
CC fortification, by the food fortification agencies, to provide a universal
CC fortification, by the food fortification agencies, to provide a universal
CC fortification, by the crime related to offenses such as murder and rape,
CC fortification, by the crime related to offenses such as murder and rape,
CC fortification of the crime related to offenses such as murder and rape,
CC fortification of the crime related to confuse the crime investigators and
CC forming scientists with human blood, and so that the method can be
CC forming scientists with human blood, and so that the method can be
CC forming the forminal prime in the scene of the crime investigators and
CC forming the forminal prime the scene of the crime investigators and
CC forming the forminal problem and so that the method can be
CC forming the forminal problem and so that the method can be
CC forming the forminal problem and so t converted to a commercial molecular kit and DNA chips based applications for wildlife identification in forensics. The present sequence represents mitochondrial cytochrome b gene sequence from the present invention

The present introduction user. Incept samplifying a fragment of creek AB083297 and AB083299, capable of amplifying a fragment of cytochrome b gene of any animal species in polymerase chain reaction (PCR) and revealing the identity of the biological material of any animal of unknown origin at species and sub-species level. Also described is a method for the identification of the animal from a biological sample. The method for the identification to establish the crime with the criminal beyond a reasonable doubt, to establish the identity of biological materials such as skin, horns confiscated from animal criminal beyond a reasonable doubt, to establish the identity of biological materials such as skin, horns confiscated from animal crime in it is that of an endangered species, for the purpose of molecular evidence of animal hunting and related crime in the court of law, so that human violation of the geographical location of the controlled, to have an idea of the geographical location of the commitment of wildlife crime based on the cytochrome b gene haplotype of poached animal identified by the universal primer invented, to detect the commitment of animal meat in food products for the purpose of food fortification by the order to establish the origin of blood or blood stains collected from the scene of the crime telated to offenses such as murder and rape, in order to establish the origin of blood or blood as murder and rape, in order to establish the origin of blood found at the scene of the crime to confuse the crime investigators and animal at the scene of the crime to confuse the crime investigators and The present invention describes universal primers, mcb 398 and mcb 869

The present invention describes universal primars, man stock of see AB083297 and AB083298), capable of amplifying a fragment of cytochrome b gene of any animal species in polymerase chain reaction cytochrome b gene of any animal species in polymerase chain reaction of unknown origin at species and sub-species level. Also described is a coff unit of its used for animal identification to establish the crime with the criminal beyond a reasonable doubt, to establish the rime with the criminal beyond a reasonable doubt, to establish the identity of the purpose of biological materials such as skin, horns confiscated from animal criminal beyond a reasonable doubt, to establish the identity of any so that human violation of the wildlife resources could be controlled, to have an idea of the geographical location of the controlled, to have an idea of the geographical location of the controlled, to have an idea of the geographical location of the controlled, to have an idea of the geographical location of the controlled, to detect the confinent of wildlife crime based on the cytochrome b gene haplotype of poached animal identified by the universal primer invented, to detect the confinence of the crime related to offenses such as murder and rape, in order to establish the origin of blood or blood stains collected from the scene of the crime to confine the crime investigators and former animal at the scene of the crime to confine the crime investigators and formed to animal at the scene of the crime to confine the crime investigators and converted to a commercial molecular kit and DNA chips based applications of the crime from the present invention. 360 240 300 120 61 TCCCATATATCGGCACAGACCTGGTCGAATGAATCTGAGGAGGATTCTCCGTAGACAAAG 120 121 CAACCCTTACCCGATTTTTCGCCTTCCACTTTATTCTCCCCTTTATTATCGCTGCCCTTG 180 300 360 420 420 09 9 181 ccaracrecrateracretricrecaecaaaacaecrecaacaaecrecraeaeaarecer CAGACGCAGACAAAATTCCATTCCACCCTACTACACTATCAAAGATATCCTAGGAGCTC 241 CAGACACAGACAAAATCCCATTCCACCTTACTATACCATTAAAGACATCTTAGGCGCCC 301 TACTACTAATTCTAGTCCTCATACTACTATTATTCACACCCGACCTACTTGGAGACC mcb 398 and mcb 869 61 TCCCATACATCGGTACAAACCTAGTAGAATGAATCTGAGGGGGTTCTCAGTAGATAAAG 121 CAACCCTTACCCGATTTTTCGCCTTCGACTTTATCCTCCCATTTATCATTGCAGCCCTTA CCATAGTACACCTACTGTTTCTCCACGAAACAGGATCCAACAACCCCACAGGAATCTCAT TACTATTAATTTTAACCCTCATGCTTCTAGTCCTATTCTCACCGGACCTGCTTGGAGACC CAGACAACTATACACCAGCAAACCCACTTAATACACCCCCACATATCAAGCCCGAATGAT 361 cagacaarraraccccagcaaarccacrragcacgcccccccacarcaaaccrgaargar 1 TGCCATGAGGACAAATATCATTCTGAGGAGCAACAGTCATCACCCAACCTTCTCTCAGGAA mitochondrial cytochrome b gene sequence from the present invention 1 TACCATGAGGACAAATATCTTTTGAGGAGCAACAGTCATCACCAATCTCCTTTCAGCAA Gaps New universal primers, mcb 398 and mcb 869, capable of amplifying a fragment of cytochrome b gene of any animal species, useful for establishing the identity of biological materials and animals for .. 0 ACTICCTATITIGCATACGCAATCCTCCGATCAATTCCTAACAACTAGGAGG Score 372.8; DB 8; Length 472; Pred. The present invention describes universal primers, mcb 398 and mcb 869 (see AB033297 and AB033298), capable of amplifying a fragment of cytochrome begane of any animal species in polymerase chain reaction of (PCR) and revealing the identity of the biological material of any animal cof unknown origin at species and sub-species level. Also described is a certood for the identification of the animal from a biological sample. The criminal beyond a reasonable doubt, to establish the identity of poachers, if it is that of an endangered species for the purpose of controlled, rot have an idea of the geographical location of the court of molecular evidence of animal hunting and related crime in the court of controlled, to have an idea of the geographical location of the commitment of wildlife crime based on the cytochrome b gene hapolytype of poached animal identified by the universal primer invented, to detect the adulteration of animal meat in food products for the purpose of foot fortification, by the food fortification agencies, to provide a universal from it sounds as if criminals intentionally spread the blood of an animal at the scene of the crime to confuse the crime investigators and formal at the scene of the crime to confuse the crime investigators and formal at the scene of the crime to confuse the crime investigators and formal at the scene of the crime to confuse the crime investigators and formal at the scene of the crime to confuse the crime investigators and formal at the scene of the crime to confuse the crime investigators and formal and information in forensics. The present sequence represents and animal didnife indentification in present sequence represents a mitochondrial cytochrome b gene sequence from the present invention

Mitochondrial cytochrome b gene; mitochondrial; cytochrome b; identification; criminal investigation; animal poaching; gene; ds. Mitochondrial cytochrome b gene sequence SEQ ID NO:18.

Unidentified

The present invention describes universal princip.

(see AB083297 and AB083298) capable of amplifying a fragment of cytochrome b gene of any animal species in polymerase chain reaction (PCR) and revealing the identity of the biological material of any animal of the identification of the animal from a biological sample. The method is used for animal identification to establish the crime with the criminal beyond a reasonable doubt, to establish the identity of biological materials such as skin, horns confiscated from animal conference of animal butting and related crime in the court of poachers, if it is that of an endangered species, for the purpose of controlled, to have an idea of the geographical location of the controlled, to have an idea of the geographical location of the controlled, to have an idea of the geographical location of the commitment of wildlife crime based on the cytochrome b gene haplotype of poached animal identified by the universal primer invented, to detect the condition of animal meat in food products for the purpose of food fortification, by the food fortification agencies, to provide a universal confirmation of animal meat in food products for the purpose of food fortification by the origin of blood conformation of animal at the scene of the crime related to offenses such as marder and rape, in order to establish the origin of blood found at the scene of the crime to confuse the crime investigators and conversed to a commercial molecular kit and DNA chips pased applications conversed to a commercial molecular kit and DNA chips based applications conversed to converse the animal at the scene of the crime to converse the converse to a commercial molecular kit and DNA chips based applications. present invention describes universal primers, mcb 398 and mcb 869 converted to a commercial molecular kit and DNA chips based application for wildlife identification in forensics. The present sequence repress a mitochondrial cytochrome b gene sequence from the present invention New universal primers, mcb 398 and mcb 869, capable of amplifying fragment of cytochrome b gene of any animal species, useful for establishing the identity of biological materials and animals for Sequence 472 BP; 147 A; 145 C; 63 G; 117 T; 0 U; 0 Other; Example 1; Page 28-57; 128pp; English. molecular evidence in forensics (COUL) COUNCIL SCI & IND RES 28-MAR-2001; 2001WO-IN000055 28-MAR-2001; 2001WO-IN000055 WPI; 2003-018945/01. The present invention describes universal primers, mcb 398 and mcb 869 (see AB083297 and AB083298), capable of amplifying a fragment of cytochrome b gene of any animal species in polymerase chain reaction (PCR) and revealing the identity of the biological material of any animal for the biological material of any animal cof unknown origin at species and sub-species level. Also described is a method for the identification of the animal from a biological sample. The method for the identification of the animal from a biological sample. The criminal beyond a reasonable doubt, to establish the identity of biological materials such as skin, horns confiscated from animal correct of an endangered species, for the purpose of biological revidence of animal hunting and related crime in the court of law, so that human violation of the wildlife resources could be commitment of wildlife crime based on the cytochrome b gene haplotype of poached animal identified by the universal primer invented, to detect the adulteration of animal meat in food products for the purpose of confication, by the food fortification agencies, to provide a universal confication, by the food fortification agencies, to provide a universal confication of the crime related to offenses such as murder and rape, in order to establish the origin of blood found at the scene of the crime related to found at the scene of the crime related to found at the scene of the crime related to animal at the scene of the crime related to animal at the scene of the crime intentionally spread the blood of animal animal at the scene of the crime to confluse the crime investigators and forensic scientists with human blood, and so that the method can be Example 1; Page 28-57; 128pp; English.

```
converted to a commercial molecular kit and DNA chips based applications for wildlife identification in forensics. The present sequence represents a mitochondrial cytochrome b gene sequence from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                       360

The present invention describes universal primers, mcb 398 and mcb 869 (see ABQ83297 and ABQ83298), capable of amplifying a fragment of youtchinnee b gene of any animal species in polymerase chain reaction (PCR) and revealing the identity of the biological material of any animal of unknown origin at species and sub-species level. Also described is a method for the identification of the animal from a biological sample. The method is used for animal identification to establish the crime with the criminal beyond a reasonable doubt, to establish the identity of biological materials such as skin, horns confiscated from animal molecular evidence of animal hunting and related crime in the court of law, so that human violation of the wildlife resources could be controlled, to have an idea of the geographical location of the commitment of wildlife crime based on the cytochrome b gene haplotype of goached animal luchtified by the universal primer invented, to detect the adulteration of animal meat in food products for the purpose of food fortification, by the food fortification agencies, to provide a universal from the scene of the crime related to offenses such as murder and rape, in order to establish the origin of blood found at the scene of the crime crime. LOT WILDLITE LIGHTILICATION IN forensics. The present sequence represents a mitochondrial cytochrome b gene sequence from the present invention converted to a commercial molecular kit and DNA chips based applications for wildlife identification in forensics. The present sequence represents when it sounds as if criminals intentionally spread the blood of an animal at the scene of the crime to confuse the crime investigators and forensic scientists with human blood, and so that the method can be Mitochondrial cytochrome b gene; mitochondrial; cytochrome b; identification; criminal investigation; animal poaching; gene; ds. New universal primers, mcb 398 and mcb 869, capable of amplifying fragment of cytochrome b gene of any animal species, useful for establishing the identity of biological materials and animals for Mitochondrial cytochrome b gene sequence SEQ ID NO:15.
